corresponding amino acid residue in the parent peptides. For example, retropoptides or retroinverse peptides, provided that the immunoretroids are capable of forming complexes with the antimumunoretroid antibodies and with antibodies directed against the parent proteins and/or the parent peptide enantioners or parent proteins and/or the parent peptide enantioners or parent proteins and/or the parent peptide enantioners or parent proteins and/or the parent peptide enantioners or parent protein enantioners. The immunoretroids are used to prepare medicaments for preventing or treating pathologies associated with the presence of an exogenous or endogenous protein capable of being implicated directly or indirectly in the appearance and/or development of the pathologies. Immunoretroids can also be used to prepare vaccines for preventing pathologies associated with the presence of an exogenous or preventing pathologies associated with the presence of an exogenous or endogenous protein recognised by antibodies directed against an immunoretroids. Comparisons containing immunoretroids associated with a immunoretroids capable of inducing production of antibodies against an experience of an exogenous or carrier molecule capable of inducing production of antibodies against an
                                                                                                                                                                                                                                                                                                         exogenous or endogenous protein responsible for a pathology, or of inducing a cytotoxic callular immune response are useful as vaccines. Pathologies that can be diagnosed or treated are especially viral or bacterial infections, autoimmune diseases and neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic DNA coding for the wild-type universal Th epitope from tetanus toxoid, designated TT830, was fused to the 3'-end of DNA encoding heavy chain sequences from the humanised anti-Fc gamma RI monoclonal antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant, multi-specific anti-Fc receptor antibody molecules - also comprise an anti-target portion, used for the treatment of cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Humanised antibody; anti-Fc receptor; H22; bifunctional; bispecific;
fusion protein; chimera; tetanus toxoid; helper T cell epitope;
                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a cytotoxic T epitope related retro-partly inverso peptide relating to the retropeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 74; DB 2; Length 15; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                 Epitopic peptides may be used with synthetic hapten derived from a pathogen to generate an immune response to the pathogen. Peptides are recognised by numerous Thelper cell clones within the context of a wide range of alleles of the human MHC. The peptides may be used in an antimalarial vaccine inducing Ab. response to P.falciparium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Therapeutic and diagnostic uses of retro peptide analogues - corresp. to parent peptide chains with CONH linkages replaced by NHCO linkages, also antibodies against the peptide(\epsilon).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunoretroid antibodies, where the immunoretroids are peptide analogues in which one or more (preferably all) of the COMH linkages in the chain of the corresponding parent peptides are replaced by NHCO linkages and the chirality of each amino acid residue, whether involved in NHCO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunoretroid; anti-immunoretroid; CONH linkage; NHCO linkage; retropeptide; retroinverse peptide; vaccine; viral; bacterial infection; autoimmune disease; neurodegenerative disease; retro-partly;

```
ö
H22. The resulting fusion protein was shown to be significantly more efficient in antigen presentation and T cell stimulation that the TT830 epitope alone. A similar fusion construct was prepared coding for a mutant, antagonistic form of the epitope (designated TT833S) fused to the anti-Fc gamma RI. The Fab20-TT833S is at least 100 times more effective than TT833S in inhibiting T cell activation
                                                                                                                                                                                                                                                                                                                              T-cell stimulatory peptide; immunogen; non-dendritic; carrier; tumour; scaffold; inhibition; metastasis; wound healing; solid phase.

They are used to enhance host immune response to vaccines. The specification describes a Plasmodium yoelli liver stage 17 kDa hepatic and erythrocytic stage protein designated PyHEP17. This protein elicits a response from an Igl monoclonal antibody designated Navy Yoelli Liver Stage 3 (NYLS3). This antibody does not recognise sporozoites, but does recognise P. yoelli liver stage parasites. NYLS3 eliminates upto 90% of liver stage parasites. The specification describes a vaccine for reducing the severity or incidence of infection by a malaria parasite of the genus Plasmodium. The DNA vaccine comprises exon 1 and part of exon 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccine for protecting mammal against infection by malaria caused by Plasmodium species - comprises a first nucleic acid encoding a first polypeptide capable of eliciting an immune reaction against an antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

through a linker to a solid phase, forming a complex of (A)-solid phase.

Through a linker to a solid phase, forming a complex of (A)-solid phase.

Through a linker to a solid phase, forming a complex of (A)-solid phase.

Through a linker to a solid phase capable of forming a secondary structure in a benign buffer after liberation from the solid phase, and further the (A)-solid phase complex comprises an immunogenic substance and/or an immune mediator coupled on (A). The present sequence represents a peptide used in an example from the present invention. An (A)-solid phase complex can be used as a scaffold for the production of chemical characterised by covalently attaching molecules at attachment points. Alternatively (A) is used as a scaffold-peptide for the incorporation into an Immunostimulating Complex (Iscom) resulting an (A)-Iscom complex which is used for the chemical coupling of antigenic substances in an aqueous solution by conjugation. (A) derivatised with one or more peptides having fibronectin-, laminin- or vitronectin-like binding activities can be used for the promotion of cell-attachment to plastic surfaces, in particular to inhibit tumour growth and metastasis, and for promotion of wound healing. Also a derivatised (A) can be used for the selection of specifically-binding aptamers or as a diagnostic corpusation. Such diagnostic-(A) molecules could be used to detect molecules

The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused via a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a T-cell epitope peptide used to generate the chimeric peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Covalently reactive antigen analog, CRAA, catalytic antibody, electrophilic reaction centre, phosphonate, boronate, vaccine, transition state analog, TSA, isostere, gpl20, HIV-1, T-helper, tetanus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic chimeric fimbrin peptide - useful for vaccination against non-
                                                                                                                   Chimeric; non-typable Haemophilus influenzae; fimbrin; T-cell epitope;
                                                                             T-cell epitope peptide #4 for chimeric fimbrin/T-cell epitope peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 74; DB 2; I 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a new carbohydrate peptide conjugate, which comprises a carrier with a dendrimeric poly-lysine enabling multiple epitopes to be covalently attached to it. Also claimed are: (1) an antibody purified from biological fluid or cells of organisms administered with the carbohydrate peptide conjugate, and (2) a diagnosis kit comprising antigen-specific antibodies elicited by immunisation with the carbohydrate peptide conjugate, antibody and diagnosis kit are used to provide pharmaceutical compositions and vaccines against tumours. These can be used to support an immune response against viral infections caused by hepatitis virus, HIV or cycomegalo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             virus. They can be used to enhance immune responses, especially B- and T-cell responses, of humans and animals against bacterial infections. The carbohydrate peptide conjugate stimulates the antibody and T-cell response without stimulating undesired immune responses. The composition is capable of increasing the survival of tumour bearing humans and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      animals. The present sequence corresponds to residues \tilde{8}30-844 of tetanus toxin. The synthetic peptide corresponding to this sequence may be used as an epitope in a carbohydrate peptide conjugate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Carbohydrate peptide conjugate used as vaccine - comprises carrier with dendrimeric poly-lysine enabling multiple epitopes to be covalently

                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                      The patent discloses new covalently reactive antigen analogs (CRAA) of formula X1-Y-B-X2, in which X1 and X2 represent peptide sequences of an epitope of a disease-associated protein, Y is a positively charged amino acid residue, preferably Lys or Arg, and B is an electrophilic reaction control of the epitope, the CRAA may be used to stimulate production of identity of the epitope, the CRAA may be used to stimulate production of catalytic antibodies specific for predetermined antigens associated with particular medical disorders. They may also be used to permanently inactivate endogenously produced catalytic antibodies produced in certain autority associated with cautolimune diseases as well as in certain lymphoproliferative disorders. Amongst the specifically exemplified CRAAs is one based on residues 421-436 of a B-cell epitope of gpl20 (see AAY04046) which may be used to counter HYV-1 infections. When used as an immunogen, preferably this CRAA is conjugated at its N-terminal to a T-helper epitope from tetanus toxodd. The present sequence represents the T-helper epitope and corresponds to residues 830-844 of the toxoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                              New covalently reactive antigen analogs used for treating e.g. autoimmune diseases, lymphoproliferative disorders, cancers, microbial infections,

ö
This sequence represents a tetanus toxoid epitope and is recognised by the multispecific single chain antibody designated H22. The antibody can be used in the method of the invention for inducing antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell which is characterised by overexpression of HER 2/neu or epidermal growth factor receptor (BGER), comprises contacting the tumour cell with a multispecific protein molecule (preferably a single chain antibody comprising: (a) an anti-FC receptor antibody or an antigen binding fragment; (b) a portion which binds to HER 2/neu; and (c) a portion which be used for treating cancers especially breast cancer or ovarian cancer. The multispecific antibody can also be administered prophylactically to vaccinate a subject against infection by a target cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGRB). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The claims detail a method for inducing immune responses against weakly

The present sequence is the tetanus toxoid T-cell epitope P589, derived from Clostridium tetani. It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His) 6 tag, T-cell epitope from tetanus toxoid and 21 antiganic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (MAM-1), erythrocyte binding antigen-175 (BBA-175), rhoptry associated protein-1 (MAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P.
                                                                                                                                                                                                                                                ö
; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and human/murine FSBsb comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope (e.g. PZ and/or P30) are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Herz, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle.

The present sequence represents the tetanus toxoid P2 epitope. It is used to create a fusion protein with murine osteoprotegerin ligand (OPGL). Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 81% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL activity in an animal. The method comprises using at least one OPGL animal response in the animal. The method and OPGL analogue to induce in the animal. The method and OPGL polypeptide are useful for treating, preventing and amaliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption

compound for prevention and treatment of allergies comprises at least allergen antigenic determinant recognized by a B cell and at least antigenic determinant which does not trigger T cell activation. New

Example 6; Page 30; 50pp; English.

The present invention describes a compound (I) for the prevention and/or treatment of allergy. The compound comprises at least one allergen antigent determinant (i) recognised by a B cell or an antibody secreted by a B cell of a non-atopic individual and at least one antigenic determinant (ii) different from the allergen that triggers T cell activation. (I) has antiallergic, antiasthmatic, antinflammatory.

C dermatological and immunosuppressive activities, and can be used in a vaccine. (I) may be used in a pharmaceutical or cosmetic medicanent to repectally hypersensitivities. These include rhinitis, sinusitis, bronchial asthma, atopic dermatitis, some forms of acute and chronic urticaria, gastro-intestinal syndromes associated with the ingestion of too allergams, oro-pharypaeal syndrome, anaphylactic reactions associated with drug hypersensitivities and/or a mixture of these. The use of (I) in the treatment of allergic conditions avoids the need for drug therapies alleviate symptoms, but do not influence their causes, however (I) actually combate the cause of an allergic reaction. The presents sequence represents a peptide, which is used in an example from the contraction. the present invention

Cleavage of Caulobacter produced recombinant fusion proteins useful for producing vaccine peptides.

Example 2; Page 16; 33pp; English

The patent discloses a method for cleaving a recombinant fusion protein which is produced by Caulobacter and consists of Caulobacter surface layer (S-layer) protein (containing the C-terminal secretion signal) and a target protein heterologous to Caulobacter. The cleavage of target protein heterologous to Caulobacter. The cleavage of target protein heterologous to carried out under mild acid conditions so that cleavage occurs at aspartate-proline dipeptide site without solubilising the protein. The cleavage is accomplished while the fusion protein is in an insoluble aspartate-proline dipeptide site purification of the protein. The method is useful for producing pure purification of the protein. The method is useful for producing pure printing the protein protein minal therapeutic antibiotic and vaccine peptides, enzymes, protein polymers, and antibiotic and vaccine peptides, enzymes, protein polymers, and antibiotic and vaccine peptides, enzymes, protein protein. This sequence was fused to a DNA encoding a fragment of Infectious pancreatic necrosis virus surface glycoprotein which is a vaccine candidate. This chimeric protein was in turn fused to DNA encoding C crescentus S-layer secretion signal acid 690 onwards and contains native Asp-Pro site) for construction of a recombinant fusion construct which is expressed in Caulobacter and then C-terminal portion of the S-layer protein from amino recombinant fusion construct which is expressed : cleaved to recover the vaccine candidate protein (corresponds to the

The invention relates to a method for in vivo down-regulation of amyloid protein such as beta amyloid (Abeta) in an animal, including human. The method comprising presenting to the animal's immune system an immunogenically effective amount of at least one amyloidogenic protein or its subsequence and/or at least one analogue of the amyloidogenic protein or its subsequence, and its analogue is useful for the preparation of an immunogenic composition comprising an adjuvant for down-regulating amyloid deposits. They are also useful in the treatment, prophylaxis or amelioration of Alzheimer's disease or other diseases characterised by amyloid deposits. They are also useful in the treatment of systemic amyloidosis, maturity onset disease or other diseases tharacterised by amyloid deposits. They are also useful in the treatment of systemic amyloidosis, maturity onset disease. Parkinson's disease, Huntington's disease, fronto-temporal commentia, amyotorophic lateral sclerosis (ALS), Pick's disease and prion-related transmissable apongiform encephalopathies. They are also useful for inducing production of antibodies against an amyloidogenic polypeptide. The present sequence is Clostridium tetani P2 epitope
                                                                                                                                                                                                                                                                                                                                                          In vivo down-regulation of amyloid protein for the treatment of Alzheimer's, comprises presenting an amyloidogenic polypeptide or its subsequence and/or at least one analogue of the amyloidogenic polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amyloid disease; amyloid fibril deposition; amyloid plaque; immunogenic; antibody; vaccine; Alzheimer's disease; type 2 diabetes; reactive system amyloidosis; systemic senile amyloidosis; familial amyloid cardiomypathy; transmissible spongiform encephalopathy; creutzfeld-Jakob disease; Kuru, haemodialysis-asssociated beta-2-microglobulin deposition; carrier protein; universal T-cell epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amyloid protein; neuroprotective; nootropic; immunostimulant; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel pharmaceutical composition for preventing or treating a disease characterised by amyloid fibril deposits (amyloid plaques) in a pattent. The pharmaceutical composition comprises on agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity against a selected amyloid component. A patient serum immunoreactivity of at least four times a base line serum immunoreactivity or control level indicates a prognosis of improved status with respect to the disorder. The pharmaceutical compositions of the invention are useful for treating a wide variety of disorders characterised by amyloid beta peptide fibril deposition in a patient. Such disorders include Alzheimer's disease characterised by amyloid beta peptide fibril deposits; type 2 disease characterised by amyloidosis associated with systemic inflammatory diseases (e.g., rheumatorid arthritis, osteomyelitis, tuberculosis) characterised by AA fibrils derived from serum amyloid cardiomyopathy characterised by ATTR (ibrils derived from transthyretin (TTR); transmissible spongiform encephalopathies (e.g. Creutzfeld-Jakob disease, Kuru) characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result of the characterised by result
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition comprising immunogen against amyloid component such as fibril peptide or protein, or antibody against amyloid component useful for treating amyloid diseases or amyloidoses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Glutamic acid, glutamine, vaccine, major histocompatibility complex, MHC; immunomodulator; antiallergic; endocrine; neuroprotectant; virucidal; bactericidal, antiparasitic; fungicidal; cytostatic; medicine; pharmaceutical; immune disorder; immune deficiency; autoimmune; hypersenstitivity; allergy; graft rejection; infection; hormonal disorder; central nervous system disease; cancer; melanoma; anti-melanoma vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           result of long term haemodialysis treatment. The present sequence represents a universal T-cell epitope which may be used as a carrier for an epitope derived from an amyloid plaque component in a composition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The present invention describes a pharmaceutical compound (I) that
contains an N-terminal glutamic acid (Glu) or glutamine (Gln) residue in
the form of an addition salt with a strong, physiologically acceptable
acid (II). Also described are: (a) a pharmaceutical composition
acid (II). Also described are: (a) a pharmaceutical composition
containing at least one (I); (b) a vaccine containing at least one (I)
containing at least one (I); (b) a vaccine containing at least one (I)
containing at least one (I); (b) a vaccine containing at least one (I)
corporated for in vitro diagnosis of diseases associated with the presence of
corporation (I). (I) has immunomedulator, endocrine, antiallergic,
corporated activities. (I) has immunomedulator, endocrine, antiallergic,
corporated activities. (I) are useful, in human or veterinary medicine,
corporated activities. (I) are useful, in human or veterinary medicine,
corporated activities. (I) are useful, in human or veterinary medicine,
corporated activities. (I) are useful, in human or veterinary medicine,
corporated corposations (for treating immune disorders, e.g.
corporated corposation, hormonal disorders and central nervous system
corporated with infersor of (I) is a MHC ligand (Ia), in vaccines for
corporated with interactions between MHC and (I), e.g. melanoma and human
corporated with interactions between MHC and (I), e.g. melanoma and human
corporated in pharmaceutical compounds from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Stabilized pharmaceutical containing N-terminal glutamic acid or glutamine, useful e.g. in anti-melanoma vaccines, is an addition salt

The invention relates to a bispecific molecule (I) comprising specific binding sites for an Fcalpha receptor and an epidermal growth factor (EGF) receptor. It also provides bispecific molecule (II) comprising a human antibody, preferably a single chain antibody, specific for an Fcalpha receptor, linked to EGF, a bispecific molecule (III) comprising specific binding sites for an Fcalpha receptor and a HER2 receptor; (3) a multispecific molecule (IV) comprising specific binding sites for Fcalpha receptor, HER2 receptor and EGF receptor; (4) a multispecific molecule (V) comprising a human antibody specific for an Fcalpha receptor, and EGF. (I) can be used for antibody specific for a HER2 receptor, and EGF. (I) -(V) can be used for
                Compositions comprising polypeptides and polynucleotides for stimulating the immune system and for treating malignancies associated with overexpression of the HER-2 protein.
                                                                                                                                                  The present invention relates to compositions for stimulating the immune system and for treating malignancies associated with overexpression of the HER-2 protein. The compositions comprise immunogenic groups of the HER-2 proteins. The present sequence is one such peptide used in the compositions of the present invention. The compositions on be used for treating cancer, e.g. breast, ovarian, lung, prostate and colon cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fcalpha receptor; epidermal growth factor; EGF; HER2 receptor; tumour; immune thromboorytopenia purpura; systemic lupue erythematosus; vaccine; cytostatic; antivital; protozoacide; antifungal; immunosuppressive; antifufammatory; dermatological; hemostatic; tetanus toxoid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease
                                                                                                                                                                                                                                                                                                           Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

It is an object of the invention to produce a recombinant therappeutic vaccine capable of effecting down-regulation of growth differentiation factor 8 (GDF-8) in order to increase the muscle growth rate capable of breaking autotolorance against autologous GDF-8. These comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as the cyr promiscuous tetanus toxin T-cell epitope P2 or P30. The high number of Cys residues in the C-terminal region limits the possible sites in which the T-cell epitope can be positioned without major disturbance of the native 3-diamensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Downregulation of GDF-8 activity can increase muscle mass by up to at least 45% in catlle, pigs and poultry used for meat production, reducing the meed for antibiotic feed-additives. Anti-GDF8 vaccines can be used to reat human diseases such as cancer cachakia where muscle attophy is
                                                                                                                                                                                      ö
inducing effector cell killing of tumour cells. The molecules can be used to treat or prevent viral, protozoal, or fungal infections, or autoimmune diseases such as immune thrombocytopenia purpura and systemic lupus erythematosus. The present sequence represents a wild-type tetanus toxoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tetanus toxin, T-cell epitope, growth differentiation factor 8, GDF-8, myostatin, down-regulation, vaccine, muscle, meat, cachexia, cardiant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a new method for inducing killing of a tumor cell which expresses HER 2/neu or epidermal growth factor receptor teGERN. The method comprises contacting the tumor cell with a multispecific protein comprising a component, preferably an antibody, which binds to an Fc receptor (FCR), Her 2/neu or EGFR. The method is useful for inducing killing of a tumor cell from breast cancer, sarcoma, carcinoma, or ovarian cancer. Specific multispecific proteins can also be administered to a subject to treat or prevent other diseases or conditions, including pathogenic infections (e.g., viral (such as HIV)), protozoan infections (such as Toxoplasma gondii), fungal infections (such as candidasis), and an autoimmunity (e.g. immune thrombocytopenia purpura and systemic lupus). The present sequence represents a wild-type tetanus toxin TT830 epitope
                                                                                                                                                                                                                                                                                                                             HER 2/neu; epidermal growth factor receptor; EGFR; multispecific protein; FC receptor; FCR; tumor cell; breast; cancer; sarcoma; carcinoma; HIV; pathogenic; Toxoplasma gondii; candidiasis; systemic lupus; cytostatic; immune thrombocytopenia purpura; immunosuppressive; antiviral; antifungal; antiprotozoal; TT830; tetanus toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing killing of tumor cells which expresses HER 2/neu or epidermal growth factor receptor (EGFR) by contacting the cell with multispecific proteins comprising an anti-Fc receptor, -Her 2/neu or -EGFR antibody, useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
the important response to Desmodium vivax. (I) comprises antigenic determinants, fragments to conservative substitutions, darived from more than one stage in a life cycle of a Plasmodium vivax. (I) comprises antigenic than one stage in a life cycle of a Plasmodium vivax parasite. (I) is susful as a vaccine for stimulating an immune response, specifically a protective immune response that confers increased resistance to infection by Plasmodium parasites, such as P. vivax. (I) is especially useful in the treatment, prevention and reduction of malarial infection, as reages to diagnostic reagents for the detection of Plasmodium species in a biological sample, and for conferring immunity against multiple stages of the malarial parasite. The antibodies produced are useful for the detection or measurement of antigenic epitopes derived from one or more stages in a life cycle of a parasite, particularly P. vivax. The vaccine comprising the recombinant proteins, is cost-effective, health promoting intervention for controlling, preventing or treating the incidence of malaria. The present sequence represents the amino acid sequence of a PZ epitope, a component of the multivalent and multistage proteins vivaclp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant multivalent protein comprising antigenic determinants derived from more than one stage in a life cycle of Plasmodium vivax, useful as a vaccine for treating, preventing and reducing malarial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to recombinant multivalent proteins (I) that

The new method is used to provide an outer surface lipoprotein (OspA) of bacterial strain Piscirickettsia salmonis as a vaccine to induce immunity in fin-fish against Rickettsial septicaemia and other related Rickettsial diseases caused by either a virus, bacteria or parasite. This is the amino acid sequence of a Clostridium tetanis toxin P2 (tt P2) T cell epitope that can be fused to the Escherichia coli codon optimised OspA creating a promiscuous T cell epitope for use in creating the vaccine described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an immunogen comprising at least one first antigenic determinant that includes at least one B-cell epitope and/or at least one cytotoxic T lymphocyte (CTL) epitope, and at least one second antigenic determinant that includes a T helper cell epitope (TH epitope), where each of the first and second antigenic determinants are coupled to an activated polyhydroxypolymer carrier. The invention also relates to an immunogenic composition for raising an immune response against an antigen in a mammal, including a human. The immunogen or immunogenic composition contained in a virtual lymph node (VLN) device is useful for immunising an animal, including a human, against an antigen of choice, where the antigen shares at least one first antigenic determinant with the immunogen. This sequence represents a T halper cell epitope used in synthesis of an immunogen of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                Novel immunogen useful for immunizing an animal, has an activated polyhydroxypolymer backbone to which is attached an antigenic determinant including a B cell epitope and another determinant including a T-helper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Covalently reactive transition state antigen analogue; CRTSA; epitope; antigen; electrophilic covalently reactive centre; catalytic antibody; antibody; autoimmune disease; autoimmune thyroiditis; asthma; systemic lupus erythematosus; rhemmatoid arthritis; Reiter's syndrome; mixed connective disease; Sjogren's syndrome; vasculitis; bird shot retinopathy; lymphoproliferative disorder; myeloma; leukaemia; lymphoma; macroglobulinaemia; vaccine; immunisation; infection; dermatological; septic shock; systemic inflammatory disease; acute respiratory distress syndrome; neoplastic disease; HIV, AIDS;

The invention discloses a covalently reactive transition state antigen analogue (CRTSA), comprising a peptide sequence of an epitope of a target protein antigan (R.1), an electrophilic covalently reactive centre bearing a partial or full negative charge (E) and an electron withdrawing correlation appried sequence. The CRTSA is useful for treating a comprise a flanking speptide sequence. The CRTSA is useful for treating a catalytic antibody, which involves administering the action of a catalytic antibody, which involves administering the CRTSA, which comprises an epitope recognised and irreversibly inhibiting the action of a catalytic antibody. Preferably CRTSA is useful for treating an autoimmune disease, comprises an epitope recognised and irreversibly inhibiting the catalytic autibody. Preferably CRTSA is useful for treating an autoimmune disease, connective disease, Reiter's syndrome, vasculitis or bird sohr retinopathy, a syndrome, vasculitis or bird sohr retinopathy, a syndrome, syndrome, vasculitis or bird sohr retinopathy, a syndrome, syndrome, vasculitis or bird sohr retinopathy, a spranforme, syndrome, or catalytic antibodies (vaccine), for actively, or passively, immunising a patient against e.g. a microbial infection and for selecting catalytic antibodies on the surface of phage and B cells. This technology has applications in fields of veterinary medicine, industrial and clinical research and dermatological. The catalytic antibodies acute respiratory distress syndrome, or preventing medical disorders such as septic shock, systemic inflammatory disease, acute respiratory distress syndrome, incomplete the provides superior protection against the target antibodies or catalytic action against the target antigen which results in its permanent inactivation. The sequence presented is the tetamns toxin T epitope which can be placed on the N-terminal side of the B epitope (HIVV) the provides to a large carrier protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

```

```
The invention relates to a synthetic chimeric fimbrin peptide. The peptide is useful for treating a non-typable Haemophilus influenzae (NTH1) infection and otitis media. The synthetic peptides do not require tedious purification techniques. The present sequence represents the amino acid sequence of a Clostridium tetani T-cell epitope #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Multimeric protein; interleukin 5; IL5; TNPalpha; inflammatory disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the protein sequence of tetanus toxoid T-cell epitope P2. The invention provides methods for compositions for combatting diseases characterised by deposition of amyloid, such as Alzheimer's disease. Immunisation is preferably effected by administration of analogues of autologues amyloid precursor protein (APP) or beta amyloid (Abeta), the analogues being capable of inducing antibody production against the autologues amyloid disease. Especially preferred as an immunogen is autologous Abeta which has been modified by introduction of one or a few foreign, immunodenmant and promiscuous T-cell epitopes, such as tetanus toxoid P2 epitope. Genetic immunisation against APP or Abeta and vaccination using live vaccines are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel analog of amyloid precursor protein or beta amyloid for treating Alzheimer's disease, has amyloid precursor protein/beta amyloid incorporating B-cell epitope of amyloid protein and foreign T-helper
                                                                     Tetanus toxoid, epitope, amyloid precursor protein; APP; beta amyloid; vaccine, genetic immunisation; nootropic; neuroprotective; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```
New immunogenic analogue of a polymeric protein, useful for preparing composition for treating inflammatory diseases e.g. arthritis.
```

Example 8; Page 106; 196pp; English

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (ILE) and tumour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a tetanus toxoid epitope peptide. This sequence is used to illustrate the method of the invention

Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the Disclosure; Page 139; 140pp; English. polypeptide

The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCs) in the animal of at least 1 modified CEA polypeptide or of a microorganism nucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a tetanus toxoid (TT) p2 epitope that can be introduced into a CEA polypeptide sequence

Preventing and/or reducing pathological inflammation by administration of an agent inhibiting alpha-4 integrin or its dimer, useful in treating multiple sclerosis, Crohn's disease, ulcerative colitis or inflammatory bowel disease

Disclosure; Page 17; 89pp; English.

The present sequence is that of a universal T-cell epitope comprising amino acids 830-844 of tetanus toxoid. Universal T-cell epitopes such as this can be used as carriers of peptide agents of the invention that bind alpha-4 integrin or a dimer comprising an alpha-4 integrin subunit. Linkage to a carrier will improve the immune response to a peptide that may be too small to be immunogenic on its own. A method of chronically reducing a patient's pathological inflammation involves administration of an agent that specifically binds to an alpha-4 integrin or a dimer comprising alpha-4 integrin. The agent is administration maintains alpha-4 integrin receptor saturation to chronically suppress maintains alpha-4 integrin receptor saturation to chronically suppress pathological inflammation in the patient. The pathological inflammation is caused by inflammatory disease of the gastrointestinal tract, such as Crohn's disease, ulcerative colitis or inflammatory bowel disease, or is caused by multiple sclerosis (all claimed).

Reducing pain or increasing the threshold for nociception in an individual comprises administering an agent capable of inducing an active immune response that targets the individual's autologous tumor necrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for reducing pain or increasing the threshold for nociception in an individual comprising administering an agent capable of inducing an active immune response that targets the individual's autologous tumour necrosis factor alpha (TNFalpha). The agent has analgesic activity, and can be used in a vaccine against autologous TNFalpha. The method is useful in reducing pain or increasing the threshold for nociception in an individual. The method is especially intended for reducing neuropathic pain. The present sequence represents a tetanus toxoid P2 epitope, which is given in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a synthetic chimaeric fimbrin peptide LB1 or LB2 comprises a first peptide unit derived from H. influenzae fimbrin, a second peptide unit containing a real epitope and a third linker peptide which connects the first peptide to the second. The chimaeric peptide is useful for inducing an immune response in animals against nontypable Haemophilus influenzae (NTHi) and for preventing or reducing adherence of NTHi to host cells thereby preventing or reducing the severity of otitis media. The present sequence is a clostridium tetani T cell epitope for use in the chimaeric peptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel synthetic chimeric fimbrin peptide LB1 or LB2 comprising a first peptide unit, T cell epitope as second peptide unit and third linker peptide unit, useful for preventing or reducing severity of otitis media.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pain reduction; nociceptive; nociceptor; immune response; tumour necrosis factor alpha; TNFalpha; analgesic; vaccine; pain;

                                                                                                                                                                                                                                                                                                                 ö
                             Generating an immune response to an antigen, useful for generating desired T cell responses comprises administering an immunoglobulin having one peptide epitope of the antigen attached to the immunoglobulin.
                                                                                                                      The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. The present sequence is an antigen sequence, used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ghrelin; autologous ghrelin; ghrelin analogue; immunogen; immunisation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for immunising animals (including humans) against autologous ghrelin. The method involves presenting ghrelin (or sub-sequence thereof) or a ghrelin analogue comprising a ghrelin B-cell epitope and non-ghrelin chemical moieties to the immune system, thereby inducing the production of antibodies against the
                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunizing against autologous ghrelin in animals e.g. human beings, asstul for treating obesity, by presenting ghrelin polypeptide, its subsequence or analog, to animal's immune system, for producing antibodies against ghrelin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                anti-ghrelin antibody; obesity; anorexia; cachexia; wound; burn; adjuvant therapy; in vitro fertilisation; ghrelin-related cancer; ghrelin receptor-related cancer; anorectic; cytostatic; metabolic; immunomodulator; vulnerary; vaccine; tetanus toxin; P2 epitope;

compositions comprising ghrelin. The invention also relates to immunogenic compositions comprising ghrelin, a ghrelin sub-sequence or a ghrelin analogue of analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention; vectors and host cells comprising this nucleic acid; a compositions of identifying a modified ghrelin polypeptide capable of inducing antibodies against unmodified autologous ghrelin; and use of immunogenic compositions of the invention. The method of the invention is useful for treating, preventing or ameliorating obseits by downregulating ghrelin to characterised by excess body fat deposits by downregulating ghrelin to such an extent that the total amount of body fat is significantly decreased. The method may also be used for unregulating ghrelin for the treatment, prevention or amelioration of anorexia or cachexia. The method creatment, prevention or amelioration of anorexia or cachexia. The method creatment and for treating whuch in adjuvant therapy for in creating cancers. The present sequence represents the tetanus toxin P2 epitope, a promiscuous T-cell epitope, which may be used in ghrelin companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or

Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.

Disclosure; SEQ ID NO 31; 78pp; English.

The invention relates to a method of preventing (MI) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (MI) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manifacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.

The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response aggainst alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to amino acids 830-844 of the tetanus toxoid protein used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alpha-synuclein aggregation. This sequence corresponds to the tetanus toxoid peptide corresponding to amino acid 830-844 used in the method of the
                                                                                                                                                                                                                                                                                                                                              Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or

The invention relates to a method of synthesizing chemoselectively a carbohydrate dendrimer (CD) conjugate having a specific structure containing a functional dendrimer, a residue of a carbohydrate, and a residue of an immunomodulating substance. (CD) is useful in the creatidue of an immunomodulating substance. (CD) is useful in the production of antibodies, as a targeting compound, in medicine, in combinition of bacterial adhesion, inhibition of toxins and other such bacterial toxins in combinition of carbohydrate-mediated virus entry into host cells, in chibition of carbohydrate-mediated virus entry into host cells, in chibition of carbohydrate-mediated virus entry into host cells, in carbohydrate-mediated virus entry into host cells, in companient of an inhigh-throughput screening. (CD) are useful for treating and/or preventing bacterial diseases such as sinfection with HIV, hepatitis or influenza, fungal diseases and certain types of cancer such as carcinomas or melanomas. The method enables fast and efficient synthesis of dendrimer conjugates cancer and efficient synthesis of dendrimer conjugates controlled chemical structure. This sequence corresponds to a tetanus toxoid peptide sequence used in the method of the invention.

The invention relates to a method of in vitro antigen specific activation of antibody producing cells by culturing a population of isolated, non-adherent mononuclear immune cells, which population comprises T helper cells or its functional equivalent, where the antibody producing cells and a functionally insignificant number of lysosome-containing cells, for a time and under conditions sufficient to induce differentiation of the antibody producing cell. The method is useful for in vitro antigen specific activation of antibody producing cells. This sequence corresponds to an epitope from the tetanus toxoid protein and used in the
                                                                                                                                                                                                                                                                                                             cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel chimeric binding protein that is immunogenic in an animal. The chieric binding protein binds specifically to a first receptor that binds a second receptor present in an antigen of the animal, where the chimeric binding protein has: a B-cell epitope in the form of a binding site; a scaffold protein structure, autologous in the form of a binding site; and cat least one tolerance breaking amino acid sequence, which is heterologous in the animal and which binds to a major histocompatibility complex (MHC) class II molecule in the animal. The invention further comprises: a nucleic acid fragment that encodes the chimeric binding protein, a vector carrying the nucleic acid fragment acid fragment; a transformed cell carrying the vector; a composition for inducing production of antibodies against an antigen in the autologous host comprising the chimeric binding protein acid fragment and carrier, and down-regulating a self-cantigen or a cell that displays epitopes of the self-antigen in an animal. The chimeric binding protein has cytostatic activity. The chimeric binding protein has cytostatic activity. The chimeric binding protein has protein a vaccine against e.g. cancer. This sequence represents a 'promiseuous' T-H tetanus toxoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                              New chimeric binding protein comprising a B-cell epitope, a scaffold protein structure and a tolerance breaking amino acid sequence, useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

present invention describes a conjugate (A) comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WO200185763-A2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       15-NOV-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAU11413;
                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 46
                                                                                                                                                                                                                                                                                                                                                                                                                                    AAU11413
                                                                                                                                                                                                                                                                                                                                               ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                               유
                                                                             through a linker to a solid phase, forming a complex of (A)-solid phase.

Where (A) comprises 10-50 amino acids capable of forming a secondary

Structure in a benign buffer after liberation from the solid phase, and
further the (A)-solid phase complex comprises an immunogenic substance
and/or an immune mediator coupled on (A). The present sequence represents
and/or an immune mediator coupled on (A). The present sequence represents
and/or an immune mediator coupled on (A) the present sequence represents
a specifically claimed T-cell stimulatory peptide from the present
invention. An (A)-solid phase complex can be used as a scaffold for the
production of chemical derivatives, characterised by covalently attaching
molecules at attachment points. Alternatively (A) is used as a scaffold-
complex peptide for the incorporation into an Immunostimulating complex (Iscom)
resulting an (A)-Iscom complex which is used for the chemical coupling of
antigenic substances in an aqueous solution by conjugation. (A)
cartigenic substances in an aqueous solution by conjugation. (A)
cartigenic substances in an aqueous solution by conjugation. (A)
carticohectin-like binding activities can be used for the promotion of cell
attachment to plastic surfaces, in particular to inhibit tumour growth
and metastasis, and for promotion of wound healing. Also a derivatised
(A) can be used for the selection of specifically-binding aptamers or as
a diagnostic agent. Such diagnostic-(A) molecules could be used to detect
molecules derived from or indicative of presence (Updated on 25-MAR-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
```

```
trategically modified hepatitis B core (HEC) protein (1) attached to a hapten, where (I) includes amino acids (aa) 10-140 of the wild type HBC (183 as sequence (given in AAY29674) and additionally has an insert (II) in the region corresponding to aa's 50-100, where the insert is of 1 to about 40 aa's and contains a chemically reactive as residue linked to the nature. A vaccine containing (A), optionally in the form of particles, is used to induce a protective antibody response against the pathogen from which the hapten is derived, in humans or other animals. These pathogens which the hapten is derived, in humans or other animals. These pathogens can be bacteria, viruses, rickettsia or protoxoa. Insertion of (II) increasing the reactivity of as side chains in native HBC protein, increasing the reactivity with hapten and resulting in conjugates of improved immunogenicity. Modified HBC can be derivatised in the form of particles by well-defined chemical methods, and is unlikely to cause immunological side-effects. AAX29675 to AAX29735 represent polypeptide haptens used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a synthetic immunogen for inducing specific antibodies against gonadocropin releasing hormone (GRRH also known as luteinising hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper r-cell peptide epitope and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gonadotrophin releasing hormone; GnRH; synthetic immunogen;

```
immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is Tetanus toxoid precursor peptide, tentoxylysin, a promiscuous helper T-cell peptide epitope used in the immunogen of the invention

Novel recombinant hepadnavirus nucleocapsid protein, termed as chimeric hepatitis B core protein, displays immunogenic epitopes at N-terminus, HBc immunogenic loop with linker for conjugated epitope and C-terminus.

Disclosure; Page 43; 289pp; English.

The invention relates to a recombinant hepadnavirus nucleocapsid protein, i.e. a chimeric hepatitis B core (HBC) protein (1), displaying one or more immunogenic pitopes at the N-terminus, HBC immunogenic loop (L) or C-terminus, or having a heterologous linker for a conjugated epitope in (L), and containing a Cys residue at, or near, the C-terminus that confers enhanced stability to the particles. A vaccine comprising (I) is useful for inducing an immune response in an inoculated animal, by inoculating a host animal with the vaccine, and maintaining that inoculated animal for a time period sufficient for that animal to develop in immune response. The immunogenic particles formed using (I) are substantially free of binding to nucleic acids, and are most stable than the particle formed from otherwise identical HBc chimer that lacks the C-terminal residue or in which a C-terminal CS is replaced by another residue. The chimer particles are most stable on storage in aqueous compositions that are particles of similar sequence that lack any C-

                      exhibiting the nucleic acid binding of those native particles, and excellent. B cell and T cell immunogenicities. The chimer particles are typically prepared in higher yield than similar particles that are free of a C-terminal Cys. The particles are often far more immunogenic than the similar conjugates that lack a C-terminal Cys. Immunogenic than particles assembled from the chimer molecules are enhanced as compared to similar particles assembled from chimer molecules are enhanced as compared to terminal Cys. AAU93802-AAU93997 represent immunogenic HBc particles amino acid sequences and related sequences of the invention
The chimer molecule exhibits the self-assembly not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hepatotropic; virucide; antiinflammatory; chronic hepatitis; vaccine; recombinant hepatitis B core chimeric protein; HBc chimeric protein; hepatitis B infection; T-cel stimulator; B-cell epitope.

Treating chronic hepatitis B infection by administering a T cell-stimulating vaccine containing immunogenic particles having recombinant carboxy-terminal truncated hepatitis B core (HBc) chimeric protein molecules.

WPI; 2003-852775/79.

Disclosure; SEQ ID NO 175; 111pp; English.

The invention describes a method of treating chronic hepatitis comprising administering to a patient a T cell-stimulating amount of a vaccine comprising immunogenic particles dissolved or dispersed in a diluent, where the immunogenic particles consists of recombinant hepatitis B core (HBC) chimeric protein molecules, and maintaining the patient to induce T cells activated against HBC. The methods and compositions of the present invention are useful for treating chromic hepatitis B infection. This is the amino acid sequence of a chimeric hepatitis B infection. This is the amino acid sequence of a chimeric hepatitis B virus related B-cell epitope useful for expression within the HBV chimer at the N-terminus, within the immunoigenic loop and/or at the C-terminus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel peptides (1) of 5-40 amino acids (aa) aderived from a cytokine in which at least one as has at least one of its atoms spaced a distance (d), evaluated from structural data, less than 5 angstrom from an atom of the corresponding cytokine receptor is new. Escluded are peptides from between the 2nd and 3rd Cys of RANTES and from peptides from the 123-140 region of interferon-alpha, are useful for peptides from the 123-140 region of interferon-alpha, are useful for reatment and prevention of diseases associated with high levels of cytokines, e.g. multiple sclerosis, rheumatoid polyarthritis, psoriasis, autoimmune diabetes, lupus, allargy, asthma, cancer and AIDS. Since (1) antibodies that facilitate or potentiate cytokines is limited, and the quality of the immune response is improved by restricting the number of antiganic determinants targeted. This sequence corresponds to the tetanus

This invention relates to novel recombinant immunogenic chimeric avian hepatitis B core (AHBC) nucleocapsid proteins. Specifically, it refers to an AHBC protein that has been engineered to display, an immunogenic B cell cor T cell epitope, exhibit enhanced stability and an absence of nucleic acid binding as a self assembled particle. The present invention acid binding at the chimeric AHBC protein as truncated at the C-terminus and containing introduced cysteine residues that confers an enhanced stability in aqueous solution, an increased yield and more immunogenicity than similar conjugates that lack N- or C-terminal cysteines.

Chysine and arginine) towards the C-terminus prepares self-assembled particles that are substantially free of nucleic acid binding. As such, these composition in the number of postively charged residues (Iysine and arginine) towards the C-terminus prepares self-assembled can also be useful for developing a vaccine to produce antibodies. It can also be useful for developing a vaccine to produce antibodies. It can also be useful for developing exitibit immunoserimitant, antibacterial and virucidal activities. This peptide sequence is an exemplary T-cell epitope peptide immunogen useful for both linkage to the linker residue con the contemplated chimer and for expression within an energy or the contemplated chimer and for expression within an energy and the contemplated chimer and for expression within and contemplates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful as
                                                                                                                                                                                             immunogenic; avian hepatitis B virus; nucleocapsid; self assembled particle; immunogen; inoculum; vaccine; immunostimulant; antibacterial; virucidal; T-cell epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant chimer avian hepatitis B core protein molecule, u
an immunogen for inducing a B cell or T cell response to produce
antibodies, or as a vaccine against pathogens.
                                                                                                                                                    C_tetani T-cell peptide epitope expressed by HBc chimer Seg 165
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; SEQ ID NO 165; 278pp; English.

The present invention relates to antigenic peptides derived from tumour suppressor protein WT1 which induce HLA-A24 restricted cytotoxic T-lymphocytes. The peptides can be used in the preparation of cancer vaccine for treatment and prevention of cancer, including leukaemia, multiple myeloma, lymphoma, and cancer of the stomach, colon, breast, liver, ovary, skin, pancreas, prostate and womb. The present sequence is a polypeptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antigenic peptides derived from WT1 which induce HLA-A24 restricted cytotoxic T-lymphocytes for production of cancer vaccine and treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a recombinant chimer hepatitis B core (HBC) protein molecule that includes a peptide-bonded heterologous immunogenic epitope at the N-terminus in the HBC immunodeninant loop or the C-terminus of the Chimer, or a heterologous linker residue for a conjugated epitope present in the loop. The invention also relates to an immunogenic particle comprising the recombinant hepatitis B core chimeric protein molecules, a vaccine comprising the immunogenic particles dissolved or dispersed in a diluent, a nucleic acid that encodes a recombinant HBC protein molecule or its variant, analogue, or complement and a method for inducing an immune response in an inculated host animal consultating a host animal with a vaccine and maintaining the incoulated animal for a period of time sufficient to enable development of an immune cresponse. The recombinant chimer hepatitis B core protein molecule is used in an immunogenic particle for preparing a vaccine useful for inducing an immune response in an inoculated host animal. This sequence represents an HBC protein immunogenic B cell epitope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant chimer hepatitis B core protein molecule useful for preparing vaccine or inoculum includes peptide-bonded heterologous immunogenic epitope at N-terminus in the hepatitis B core immunodominant loop or C-

                                                                                                                                                                                                                                                                                                                          The specification describes WT1 substitution peptides, in which a cysteine residue is substituted with another amino acid residue. The WT1 substitution peptides have CTL induction activity. Peptides of the invention are used in cancer vaccines, which are applicable in the treatment of e.g. stomach cancer, prostate cancer and ovarian cancer. The present peptide represents a peptide that is mentioned in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant chimer hepatitis B core (HBC) protein molecules useful in the fields of immunology and protein engineering, in particular as an immunogen in a vaccine for Hepatitis B infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel recombinant chimeric Hepatitis B virus nucleocaspid (core) protein (HBC), up to 600 or 380 amino acid residues in length. The chimeric protein is engineered for both enhanced stability of self-assembled particles and the substantial absence of nucleic acid binding by the particles. The invention further comprises: a recombinant HBC protein chimeric molecule that has a length of 135-365 amino acid
                                                                                                                              Novel WT1 substitution peptides with cysteine replaced by specific amino acid residue and their encoded polynucleotide for cancer vaccines with CTL induction activity for treatment of e.g. stomach cancer and prostate

domains from the N-terminus that are denominated Domains I, II, III and 1V. The invention also provides nucleic acids, polypeptides, host cells, vectors and transgenic animals used in the methods of the invention. The chimeric compositions of the invention have hepatotropic and virucide useful in the fields of immunology and protein engineering, in particular for using a chimeric hepatitis B virus nucleocapsid protein as an immunogen in a vaccine for Hepatitis B infections. This sequence represents a Hepatitis B virus nucleocapsid core; This sequence polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel mutant peptides derived from SYT-SSX. Specifically, it refers to a peptide S393, which is a modified tumour antigen peptide that can be used as the active ingredient in a cancer vaccine. The present invention describes the development of mutant peptides that exhibit increased binding affinity to the HLA-A24 antigen, and as such have a favourable cytotoxic lymphocyte (CTL) induction activity. Accordingly, these peptide epitopes can be used to treat patients suffering from various tumours including synovial sarcoma, and furthermore they exhibit cytostatic activities. This peptide sequence is a helper peptide related to the S393 peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SYT-SSX; SS393; tumour antigen peptide; cancer vaccine;

AAR82571-91 are helper T cell epitopes which can be used in the preparation of a peptide immunogen that is useful in vaccines for treating allergic reactions. In the immunogen an IGE CH4 peptide is attached C-terminally to a series of amino acids including a helper T cell epitope. The immunogen may also opt. contain a fatty acid or fatty acid derivative, an invasin domain or alpha-NH2. The immunogen produces high titres of antibodies to the effector site in human IGE heavy chain (the CH4 domain peptide) which inhibit mast cell activation and reduce allergen-induced IGE prodn. The immunogens may be used in either a radially branching multimeric form or a linearly arranged monomeric form
                                                                                                                                                               IgE; CH4; immunoglobulin; epsilon; immunogen; helper T cell; epitope; vaccine; allergy; antibody; constant heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic peptide-based immunogen contg. IgB CH4 peptide and helper cell epitope - useful for eliciting antibody prodn. for allergy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    T-antigen; vaccine; antibody; T-cell; T-lymphocyte; alpha-helix; colled-coil heterodimer; core peptide; subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 74; DB 2; 1 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytotoxic I lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th) which elicits an immune response to the coupled peptide in members of a heterogeneous population expressing diverse HiA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yersinia. Spacer amino acid sequence from the invasin protein of Yersinia. Spacer amino acid sequence is ally-day, can be provided between the invasin and Th domains and between the inmune stimulator and hapten components. Mann the hapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator component. The present sequence represents a tetanus toxin helper T cell epitope which can be used as Th in the immune stimulator. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

This T-cell antigen TT2 peptide may be attached to a core peptide contained in one of the 2 subunits of an alpha-helical coiled-coil heterodimer. Each core peptide is comprised of terminal and internal AA repeat sequences. This peptide antigen is attached to the core peptide through covalent linkages to certain AA of the internal repeats. The 2 subunits of the heterodimer are arranged in a stable alpha-helical coiled coil configuration having a 1:1 stoichiometry, and the peptide antigen is disposed toward the outer surfaces of the configuration. The heterodimer may be used as a synthetic vaccine (optionally multivalent)
                                                                                                                                                                                           Hetero:dimeric polypeptide immunogen in coiled-coil configuration with different antigens on each sub:unit - useful in vaccines and for antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunoglobulin, IgE; membrane protein; human; epsilon chain; hepatitis B; membrane anchoring domain; helper T cell; surface antigen; core antigen; pertussis toxin; tetanus toxin; measles virus F protein; immunotherapy; Chlamydia trachomatis major outer membrane protein; immunogen; vaccine; diphtheria toxin; plasmodium falciparum; circumsporozoite; E. coli TraT; schistepoma mansoni; triose phosphate isomerase; allergenic reaction; allergic rhinitis; food allergy; anaphylaxis; virally-induced asthma; antihistamine; decongestant; beta-2 agonist; immunosuppression;

AAW05957-W05616 represent helper T cell epitopes used in the peptide immunogens of the invention. This sequence represents the tetanus toxin helper T cell antigen. The peptides of the invention contain one of these sequences, and a membrane-bound immunoglobulin B (19g) fragment (see used in vaccines for the immunoglobulin B (19g) fragment (see used in vaccines for the immunotherapeutic treatment of allergonic reactions, including allergor thinitis, food allergies, anaphylaxis, or virally-induced asthma. The immunogens overcome the short effective preventing the broad immunosuppression of corticosteroids. The peptides do not have the potential side effects of restlessness or sedation associated with natihistamines), associated increased morbidity in asthmatics (as seen with beta-2 agonists) and adverse hormonal activities (observed in corticosteroid users)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compositions containing immunogenic peptide epitopes for various HLA class II DR molecules useful for inducing helper T cell response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human leucocyte antigen; HLA class II; antigen epitope; pharmaceutical; immune response; chronic viral disease; cancer; autoimmune disease; rheumatoid arthritis; multiple sclerosis; mysathenia gravis; AIDS; allograft rejection; allergy; lyme disease; hepatitis; prostate cancer; glomerulonephritis; food hypersensitivity; malaria.

```
comprising a unit dose form of a peptide, or analogue, comprising an epitope selected from those represented by peptides AAY98812-Y99339 which care derived from various antigens for various human leucocyte antigen class DR molecules, representative of the world human leucocyte antigen class DR molecules, representative of the world wide population. The peptide/analogue binds to an HLA class II molecule at an IC-50 of less chan or equal to 1,000 hm. The pharmaceutical can be used to induce a choom viral diseases and cancer. Examples of diseases that can be treated using the peptide containing pharmaceutical include autoimmune crowards selected determinants and could therefore be used in cases of treated using the peptide containing pharmaceutical include autoimmune crowards selection, allergies, lyme disease, hepatitis, post-crost lendocarditis or glomerulonephritis and food food mysethenia cresponses against other immunogens can be used to enhance immune cresponses against other immunogens administered with the peptides. Diseases which can be treated using immunogenic mixtures include prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical carcinoma, lymphoma, and condytoma acuminatum. The peptides may also be used to make monoclonal antibodies useful as potential diagnostic or therapeutic agents. The peptides may also be useful as diagnostic contengents, for example, to determine the susceptibility of an individuals will be at substantial fisk of developing chronic infection. The selection of appropriate T and B cell epitopes should allow the development of epitope based vaccines particularly towards conserved epitopes of pathogens which are characterized by high sequence conserved epitopes of pathogens which are characterized by high sequence.

ö
The present sequence is that of an unidentified peptide of the invention. The invention relates to peptide compositions (see AAYS8739-66) useful as immunogens for growth promotion in farm animals. The immunogenic peptides contain helper T cell epitopes which comprise multiple class II MHC motifs and have somatostatin at either the C- or N-temrinus. They may also include an invasin domain which acts as a general immune stimulator. The helper T cell epitopes and the invasin domain elimune stimulator. The helper T cell epitopes and the invasin domain enhance the immune response against the somatostatin self-peptide

New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy.

Claim 11; Page 79; 155pp; English.

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and antigenic peptides (1). (1) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (1) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (1) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T halper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (nonanaphylaxica) antibodies. AAY79994 to AAX80084 represent amino acid sequences used in the exemplification of the present invention for

which is included in vaccines of the invention. The specification describes polyepitopic fragments of human p53, which is overexpressed in many types of cancers. The p53 polyepitopic fragments bind stably to human leukocyte antigen (HLA) type molecules. The p53 peptides induce a specific immune response. They induce cytolysis, by cytotoxic T cells (CTL), of cells that express the p53 peptides associated with appropriate HLA molecules and induce secretion of cytokines (particularly interleukin derivatives, nucleic acids encoding them and specific antibodies are used, in compositions or vaccines, to treat or prevent diseases p53-related cancers, particularly of breast, colon, lung or bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present sequence represents an antigenic fragment of tetanus protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polyepitopic fragments from the p53 protein, useful for treatment or prevention of cancer, e.g. of breast or colon.
                                                                                                                                                                                                                                                                                                                                                             Polyepitopic peptide; p53; cancer; human leukocyte antigen; HLA; immune response; cytolysis; cytotoxic T cell; CTL; cytokine secretion; interleukin-2; IL-2; IL-4; gamma-interferon; p53-related cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a broadly reactive promiscuous T helper cell (Th) epitope derived from tetanus toxin. It is conjugated to antigenic peptides derived from the CDR2-like domain of the human CD4 protein. These antigenic peptides present neutralising receptor/co-receptor effector sites of the CDR2-like domain. The peptides evoke effective antibody responses by having optimises site-specificity. The induced antibodies block human immune deficiency virus (HIV) binding and syncytia formation. They may also block CD4-Class II interactions with cother cells, deliver signals to T cells (inhibiting normal CD4+mediated immunoregulatory functions) or induce apoptosis of CD4 cells by simultaneous engagement of T cell receptors. Conjugates and peptides ontaining the antibodies against CD4 surface complexes, especially to prevent binding of HIV to CD4 and thus HIV infection, but also to treat undesprable immune responses such as transplant rejection, or autoimmune diseases (rheumatoid arthritis, systemic lupus erythematosus or peoriasis). These conjugates produce high-titre antibodies which are broadly neutralising against primary isolates from all classes of HIV-1
                                                                                                        ö

o O

Beta-amyloid precursor protein; APP; chimeric peptide; B cell epitope; vaccine; T helper cell epitope.

Clostridium tetani.

WO200142306-A2.

14-JUN-2001.

Amino acid sequence of T helper cell epitope of tetanus toxin.

(first entry)

22-AUG-2001

The present sequence represents a T helper cell epitope, which is used to create chimeric peptides of the invention. The chimeric peptides contain a N- or C-terminal end-specific B cell apitope from a naturally occurring internal peptide cleavage product of a precursor or mature protein, as a free N- or C-terminus, joined to a T cell epitope, with or without a spacer amino acid residue. Chimeric peptides comprising beta-amyloid precursor protein (APP) peptides slow down, reduce or prevent the accumulation of amyloid beta peptide in the extracellular space, interstitial fluid and cerebrospinal fluid of the brain, and aggregation interstitial fluid and cerebrospinal fluid of the brain, and aggregation of amyloid beta peptides or plaques. They also block the interaction of amyloid beta. The chimeric peptides are useful for neurotoxicity of amyloid beta. The chimeric peptides are useful for immunising humans againet the free N- or C-terminus of an internal self peptide cleavage product (e.g. APP peptide) derived from a precursor protein or a mature protein. The internal peptide cleavage product is the self molecule of the mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the form of an addition salt with a strong, physiologically acceptable contains an N-terminal glutamic acid (Glu) or glutamine (Gln) residue in the form of an addition salt with a strong, physiologically acceptable acid (II). Also described are: (a) a pharmaceutical composition containing at least one (I); (b) a vaccine containing at least one (I) where this is a major histocompatibility complex (MHC) ligand (Ia); (c) a method for in vitro diagnosis of diseases associated with the presence of (Ia); (d) a kit for method (c) that includes a (Ia); and (e) a process for preparing (I). (I) has immunomodulator, endocrine, antiallargic, neuroprotectant, virucidal, bactericidal, antiparasitic, fungicidal and cytostatic activities. (I) are useful, in human or veterinary medicine, in pharmaceutical compositions (for treating immune discretes, e.g. immune deficiency, autoimmune states, hypersensitivity, allergy, graft rejection, infection, hormonal disorders and central nervous system diseases), also, where (I) is a MHC ligand (Ia), in vaccines for treatment or prevention of: (i) viral, bacterial, parasitic or fungal infections; or (ii) of cancers. A particular application is in antifications; or (ii) of sancers. A particular application is in antimelanoma vaccines. (I) are also useful for in vitro diagnosis of diseases associated with interactions between MHC and (I), e.g. melanoma and human immunodeficiency virus infection. AAM98898 to AAM99592 represent invention methods in pharmaceutical compounds from the present invention

The present sequence represents an antigenic fragment of tetanus protein, which is included in vaccines of the invention. The specification describes polyepitopic fragments from the Nef protein of human immune deficiency virus (HIV). The Nef peptides bind stably to human leukocyte antigen (HLA) type molecules. The Nef peptides induce a specific immune response. Particularly, they induce cytolysis, by cytotoxic T cells (CTL), of cells that express Nef associated with appropriate HLA molecules and induce secretion of cytokines (particularly interleukin (IL)-2 and IL)-4, and gamma-interferon by these CTL. The Nef peptides, their derivatives, nucleic acids encoding them and specific antibodies are used, in compositions or vaccines, to treat or prevent diseases specifically acquired immunodeficiency with with immunodeficiency syndrome. The antibodies are also useful for in vitro diagnosis of these diseases
                                                                                                                                                                                   New polyepitopic fragments from Nef protein of the human immune deficiency virus, useful for treatment or pravention of acquired immune deficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            vecanus toxin; T cell epitope; CD8 response; Thi type immune response; Thi CD4-specific T lymphocyte; infection; cytotoxic T lymphocyte; CTL; antiretroviral therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is derived from a tetanus protein, and is included in vaccines of the invention. The specification describes polyepitopic fragments from the BG and E7 proteins of human papilloma virus (HPV). The HPV peptides include CD4 epitopes recognised by T helper cells. They bind stably to human leukocyte antigen (HLA) type molecules. The HPV peptides induce a specific immune response, particularly cytolysis, caused by cytotoxic T cells (CTL). They also induce secretion of cytokines cytotoxic T cells (CTL). They also induce secretion of cytokines cytotoxic antibodies are used, in compositions or vaccines, to treat or prevent diseases associated with HPV infection, e.g. cervical or vulvar intraepithelial neoplasia and invasive cancer of the cervix uteri. The antibodies are also useful for in vitro diagnosis of these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                      New polyepitopic fragments from human papilloma virus E6 and E7 proteins, useful for treatment or prevention of e.g. cervical neoplasia and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polyepitopic fragment; Nef protein; HIV; human leukocyte antigen; HLA; immune responses; cytolysis; cytotoxic T cell; CTL; cytokine secretion; interleukin-2; IL-2; IL-4; gamma-interferon; vaccine; HPV: tetanus; acquired immune deficiency syndrome.

The present sequence represents a peptide, comprising residues 830-846 of tetanus toxin. The peptide is a T cell epitope. The peptide induces a Thi 194-specific T lymphocyte cell line. To produce the cell lines, CD4+T cells are isolated from a donor sample, and are subjected to in vitro immunisation with T cell epitopes, in the presence of dendritic cells. The cell lines of the invention induce cytotoxic T lymphocytes (CTb), i.e. a CD8 response, against infectious agents such as viruses, bacteria and parasites. The cell lines are used to prevent or treat infections caused by viruses, bacteria and parasites, specifically human immune deficiency virus (HIV), especially in combination with highly active antiretroviral therapy, to restore the Thi response. Treatment with the composition
                                                                                                                                                                                                                                                                                                                                                                            causes a marked and rapid reduction in viremia but does not eradicate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Solid supports for the synthesis of compounds having an alpha-oxo-aldehyde group and peptides, made by solid phase synthesis using such

                                                                  The invention relates to solid supports, functionalized for the synthesis of compounds having an alpha-oxo-aldehyde group, a process for the synthesis of such compounds. The invention also covers peptides having an alpha-oxoaldehyde group situated in a position other than a N-terminal extremity and not being linked through amide to an amine on a side chain of lysine or ornithine, prepared using a support of the invention. This sequence represents an example of a peptide used in the method of the invention. Solid phase synthesis of alpha-oxoaldehyde peptides and other organic molecules such as non-peptidic derivatives of glyoxylic acid. Such products are themselves useful in the pharmaceutical industry for synthetic vaccines, synthesis of macromolecules, and microtitration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a novel peptide immunogen comprising a helper T cell (Th) epitope, an N-terminal fragment of amyloid beta habeta peptide (residues 1-42) linked to the epitope and optionally a spacer consisting of at least an amino acid to separate the immunogenic domains. Sequences of the invention are useful for preventing or treating Alzheimer's disease (AD) in a mammal, to produce antibodies to Abeta peptide that is cross-reactive to soluble Abeta peptides and brain tissue plaques formed from it. They are useful for aliciting a site-directed mutagenesis against the main functional/regulatory site of the Abeta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel peptide immunogen comprising a helper T cell epitope, an N-terminal fragment of amyloid beta peptide linked to the epitope, and optionally a spacer, useful for preventing or treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogen, helper T cell, Th epitope, amyloid beta, Alzheimer's disease, Abeta, AD; brain tissue plaque; immunoneutralisation, neuroprotective;

The diagnosis method is rapid and accurate. The present sequence represents a tetanus toxoid peptide used as a control in an experiment designed to detect proinsulin peptide reactive T-cells in the
peptide and for generating antibodies, which are highly cross-reactive to the soluble Abeta peptide and the amyloid plaques formed in the brain of Alzheimer's disease patients. The sequences are useful for induction of accelerated clearance of amyloid plaques and immunoneutralisation of the soluble Abeta derived toxins in the brain to prevent and treat Alzheimer's disease. They are also useful as vaccines. The present sequence is Clostridium tetani T helper (Th) cell epitope used in the

The invention relates to a novel peptide represented by formula (1) given below. The new peptide is represented by formula (1): (A) n - (Th) m - (B) o -Abeta (4-10) - (C) p where each of A, B and C are an amino acid residue or sequence of amino acid residues; n, o or p = 0-20, when o is 0 then The is directly connected to the B cell epitope Abeta (4-10) through a peptide bond without any spacer residue; Th is a sequence of amino acid residues that comprises a helper T cell epitope or its immune enhancing analogue or segment; m = 0-5; Abeta (4-10) is Pho-Arg-His-Asp-Ser-Gly-Tyr (ADM80621) or its analogue containing a conservative substitution. A peptide of the invention has neuroprotective and nootropic activity. The peptide is useful in preparing a composition for treating Alabeimer's disease. Specifically, the methods are useful for reducing the amount of amyloid deposits in the brain of an individual afflicted with Alzheimer's disease, disaggregating the amyloid fibrils in the brain of an individual can inhibitor of amyloid deposition and fibril formation. The present inhibitor represents a helper T cell epitope peptide of the invention.
                                                                                                                                                                                                                                                                                 amyloid beta, Abeta(4-10); helper T cell epitope, neuroprotective;
nootropic; Alzheimer's disease; amyloid deposit; brain; amyloid fibril.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New immunogenic peptide Abeta(4-10), useful in preparing a composition for treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

The invention describes a method of detecting an indicator (I) of type I diabetes in a subject. The method comprises obtaining a biological sample from the subject, contacting the sample with a proinsulin peptide compound (II) which stimulates an immunological response by T cells of type I diabetic subjects and detecting an immunological activity in the sample against (II) in the subject. The method is useful for detecting an indicator of type I diabetes in a subject. Also described is a method is useful for inhibiting the development or progression of type I diabetes in a subject. This is the amino acid sequence of a tetanus toxoid peptide associated with the study of proinsulin peptide reactive T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting indicator of type I diabetes in subject, by contacting sample with proinsulin peptide compound stimulating immunological response, detecting immunological activity in sample against proinsulin peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Micelle, microaggregate; induction; immune response; lipopeptide; cytotoxic T-lymphocyte; epitope; lipid; helper T-lymphocyte; HTL; tetanus; toxin; vaccine; HIV; hepatitis B virus; papilloma virus; melanoma; Plasmodium falciparum; malaria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        BXXXXXXXXXXXXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides a method for generating virus-like particle (VLP)
vaccines in an adaptable, predictable, stable and scaleable manner.
Methods are provided for making vaccines made of re-assembled VLPs.
Chemical conjugation of unique peptide or nucleic acid moietries to form chemical conjugation of unique peptide or nucleic acid moietries to form caparate populations. A predetermined amount of each of the several (one or more) different encapsidation intermediates from the different correct or more) different encapsidation intermediates from the different correct or more) different encapsidation intermediates from the different correct or more) different encapsidation intermediates such that the reassembled VLP displays more than one peptide or nucleic acid. The nucleic acid can function as a scaffold and intermediates such that the reassembled VLP displays more than one peptide or nucleic acid. The nucleic acid can function as a scaffold and can also be engineered to express an immunomodulatory protein in a cukaryotic cell. The VLP is useful as a vaccine against viral or bacterial pathogens, an anti-allergy medication, and a diagnostic reagent or combinatorial chemistry reagent (all claimed). Tobacco mosaic virus (TWV) was used as VLP carrier in examples from the invention, in which epitope sequences were fused in-frame to the TWV U1 coat protein. TWV (MDN or assembled) in vitro decorated with a single epitope (multivalent). The present sequence is that of testanus toxoid immunostimulatory poptide, or a far an analyse from the invention in the protein and a soluble from the invention or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or an entermediate or entermediate or entermediate or entermediate or entermediate or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             lergy medication or a diagnostic reagent, comprises disassembling a bacco mosaic virus and forming intact VLP of one or more encapsidation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```
The specification describes a process for binding a peptide to a hydrazone, in solution. The lipophile is non-peptidic and is of a formula given in the specification. The lipid-peptide bond is stable and the process is simpler to carry out than known methods, being in solution with a totally deprotected peptide. The method is used for call screening and targeting of hormones and neuropeptides through physiological barriers e.g. call membranes. The present peptide is functionalised by alpha-hydrazinoacetyl groups, and is used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a new pharmaceutical composition comprising a unit dose form of a peptide, or analogue, comprising an epitope selected from those represented by peptides AAY98812-Y99339 which are derived from various antigens for various human leucocyte antigen class DR molecules, representative of the world wide population. The peptide/analogue binds to an HLA class II molecule at an IC-50 of less
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compositions containing immunogenic peptide epitopes for various HLA class II DR molecules useful for inducing helper T cell response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human leucocyte antigen; HLA class II; antigen epitope; pharmaceutical; immune response; chronic viral disease; cancer; autoimmune disease; rheumatoid arthritis; multiple sclerosis; myasthenia gravis; AIDS; allograft rejection; allergy; lyme disease; hepatitis; prostate cancer; glomerulonephritis; food hypersensitivity; malaria.
                                                                             Peptides linked to lipophilic aldehyde vectors enable hormones and neuropeptides to pass through physiological barriers.
                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 74; DB 5; Length 18; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the generation of mixed micelles or microaggregates for inducing an immune response comprise: (a) a first lipopeptiale comprising at least one CTL (cytotoxic T-lymphocyte) epitope and at least one lipid unit, and (b) a second lipopeptiale comprising at least one HTL (helper T-lymphocyte) epitope and at least one lipid unit different from that of the first lipopeptide. This peptide represents an example of a lipopeptide epitope used in the invention and is derived from HIV-1. The immunogenic lipopeptide micelles are used in vaccines, especially against HIV, hepatitis B virus (HBV), papilloma viruses, p53, melanoma or Plasmodium falciparum malaria
                                                                                                                                                                                                                                                                                Immunogenic lipopeptide micelles - comprising lipopeptides containing cytotoxic and helper T\textsubscript e epitopes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "COCH2NHNH2 attached to amidated residue"

than or equal to 1,000 nM. The pharmaceutical can be used to induce a helper T cell response. The pharmaceutical focuses the immune response covards selected determinants and could therefore be used in cases of chical diseases and cancer. Examples of diseases that can be tracted using the peptide containing pharmaceutical include autoimmune diseases (rheumatoid arthritis, multiple sclerosis, and myssthenia gravis), allograft rejection, allergies, lyme disease, hepatitis, poststreptococcal endocarditis or glomerulonephritis and food streptococcal endocarditis or glomerulonephritis and food streptococcal endocarditis or glomerulonephritis and food responses against other immunogens administered with the peptides. Diseases which can be treated using immunogenic mixtures include prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinom, carvical carcinom, lymphoma, and condyloma acuminatum. The peptides may also be used to make monoclonal antibodies useful as potential diagnostic or therapeutic agents. The peptides may also be useful as diagnostic or therapeutic grammine the susceptibility of an individual condyloma the susceptibility of an individual condyloma the susceptibility of an individual condyloma the susceptibility of an individual condyloma the selection of appropriate T and B cell epitopes should allow the development of epitope based vaccines particularly towards conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conserved conse

Stabilized pharmaceutical containing N-terminal glutamic acid or glutamine, useful e.g. in anti-melanoma vaccines, is an addition salt with strong acid.

Claim 9; Page 136; 149pp; French.

The present invention describes a pharmaceutical compound (I) that contains an N-terminal glutamic acid (Glu) or glutamine (Gln) residue in the form of an addition salt with a strong, physiologically acceptable acid (II). Also described are: (a) a pharmaceutical composition acid (II). Also described are: (a) a pharmaceutical composition containing at least one (I); (b) a vaccine containing at least one (I) where this is a major histocompatibility complex (MFIC) ligand (Ia); (c) a method for in vitro diagnosis of diseases associated with the presence of (Ia); (d) a kit for method (c) that includes a (Ia); and (e) a process of propering (I). (I) has immunomedulator, endocrine, antiallargic, controprotectant, virucidal, bactericidal, antiparasitic, fungicidal and cytostatic activities. (I) are useful, in human or veterinary medicine, contingual contingual contingual and contrain infection, autoimmune states, hypersensitivity, allergy, graft rejection, infection, hormonal disorders and central nervous system creament or prevention of: (I) viral, bacterial, parasitic or fungal infections; or (ii) of cancers. A particular application is in antimalannoma vaccines. (I) are also useful for in vitro diagnosis of diseases associated with interactions between MHC and (I), e.g. melanoma and human immunodeficiency virus infection. AMM98989 to AMM98952 represent invention cumunodeficiency virus infection. Compounds from the present invention

Maleimide cluster comprising core molecule, carbohydrate core, cholic acid core, useful as template for assembling multivalent peptide.

Example 9; Fig 10; 63pp; English

The invention relates to a maleimide cluster for multivalent peptide synthesis. The maleimide cluster can comprise a core to which five or more maleimides are each attached via a linker, or it can comprise a carbohydrate or cholic acid core to which two or more maleimides are eached attached via a linker. The invention also relates to a multivalent peptide or protein comprising a maleimide cluster with identical or different peptides or proteins covalently attached to the maleimide, production of a multivalent peptide or protein; methods of vaccination, peptide drug delivery or drug targeting using the maleimide cluster; and methods of raising polyclonal or monoclonal antibodies using the maleimide cluster; and maleimide cluster. The maleimide cluster is useful as a template for the assembly of multivalent peptides. These may be used in vaccination, for peptide drug delivery or for studying protein folding. A targeting protein may also be attached to maleimide clusters to facilitate the targeting of a compound to specific cells or organelles. The present cargeting of a compound to specific cells or organelles. The present maleimide cluster in an example of the invention. ö Gaps ö Score 74; DB 8; Length 20; Pred. Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease. Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific Yednock T, Tetanus toxoid epitope fusion construct #16. Bard F, Vasquez NJ, 26-MAY-2000; 2000WO-US014810 99US-00322289 (NEUR-) NEURALAB LTD. WPI; 2001-032104/04. Clostridium tetani WO200072880-A2. 28-MAY-1999; 07-DEC-2000. Schenk DB, RESULT 81 AAB46196

This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent

antibody

ö ö This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to abbeta, the antibody binds to an amyloid deposit and induces a clearing response (Foreceptor mediated phagocytosis) against it (b) a polypeptide containing an N-terninal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of trearment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease. Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody. This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Fc receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease
                                                                                Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antiparkinsonian; antibody therapy; Lewy body; alpha-synuclein; aggregation; brain; immunogenic response; beta-amyloid;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises antibody bacta fragments in the brain of a patient, which comprises antibody binds to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (Foreceptor mediated phagocytosis) against it (b) a polypeptide containing that induces an immunogenic response gainst residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invantion have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                        Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method of preventing or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 74; DB 4; Length 22; 100.0%; Pred. The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immungenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or
                                                                  or treating disease such as Parkinson's disease characterized
                                                                                         Lewy bodies or alpha-synuclein aggregation in brain by administering ant that induces immunogenic response against alpha-synuclein and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antiparkinsonian; antibody therapy; Lewy body; alpha-synuclein; aggregation; brain; immunogenic response; beta-amyloid; Parkinson's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of preventing (MI) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by adminierering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (MI) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention.
